Attention Please:

American Changer is now building in a Surge Suppressor on every main logic board made after September 1\textsuperscript{st}, 1998. This will help eliminate power related noise problems for our customers. It will not protect you from large voltage spikes or lightning strikes over 150VAC.

If this is a concern for your area of business, we recommend purchasing a surge protector locally.

\textbf{NOTE: A POWER STRIP IS NOT A SURGE PROTECTOR.}

Thank You,
American Changer Corp
(888) 741-9840

Specifications
Operating voltage 120 VAC +10/-15 %
Power consumpt.(controller only, add hopper and validator)10w
Operating temperature 32 - 130 degrees Fahrenheit
Interface to Hoppers 24vdc & 12vdc 1.5 amps max.
Interface to Validators 120vac .5 amps max.

Warranty
CoinCo MAGPRO 00 B & MARS AE2601 Validator is warranted for two years from date of purchase.

COVERED
¥ Defect in workmanship or material.
NOT COVERED
¥ Damage caused by physical abuse.
¥ Misapplication
¥ Vandalism
¥ End users attempt, on his own to repair item
¥ Cleaning maintenance

It is the End User’s responsibility to follow cleaning maintenance procedure outline on page(s) 20/25. Any unit coming in for repair requiring only a cleaning will be charged a flat rate of $65.00 plus shipping and handling.

Dispensing System and Logic Board
The dispenser and logic board is warranted for one year from date of purchase.

COVERED
¥ Defects caused by material or workmanship.
NOT COVERED
¥ Damage caused by physical abuse.
¥ Misapplication
¥ Vandalism
¥ End Users attempt, on his own to repair.

A Return material authorization number (RMA #) must be obtained before returning a unit for repair. A copy of invoices must accompany any and all warrantee work.
UNCRATING AND SET-UP

Remove your Series AC6000/1/3 changer from the shipping box. Open the door. (The T-handles are a screw-in type and therefore, must be turned at least 10 times counter-clockwise until it opens.) Inspect for any connectors or components that may have been dislodged during shipping. The lock and keys for your changer will be inside the manila envelope along with this manual. To install the lock, insert the cylinder into the round hole in the middle of the T-handle and push until it stops. Now turn the key and lock until you hear it “snap.” Turn the key counterclockwise ¼ turn and remove the keys.

NOTE: The only way to get a duplicate set of keys made is to save the red tag that comes between the keys. This ID # starts with “ACC ####”. Write your Key # here “ACC__________”. ALL KEY ORDERS TAKE 4-6 WEEKS!!!

MOUNTING THE AC6000

Remove the bottom door of the AC6000/1/3 and locate the 4-mounting holes predrilled into the floor of the base. Using lag bolts, bolt down the machine to prevent the machine from being moved, shaken or tipped over.

REFUSAL TO MOUNT THE CHANGER OR NOT USING ALL 4-MOUNTING HOLES MAY BE DANGEROUS!!!

TEST:

Before permanently installing the changer, do a functional test to verify that there is no shipping damage to your new changer(s). Extend the power cord through the hole in the back of the changer or the bottom and plug it into a grounded 120vac outlet. The dip switches are already set for a 4 coin per dollar payout of the hoppers, and the Bill validator is ready to accept $1-$5-$10-$20 dollar bills.

Fill each hopper with at least 100 coins. On the main logic board turn the switch on the bottom right corner “ON”. (SEE FIG. 1 ON PG.3) The rocker switch has a “1” and “0” printed on it. When the “1” is pressed down the changer is “ON”.

FILLING THE HOPPERS

When each hoppers has less than 80 - 100 coins left the red “Empty” LED will light on the front of the changer. If you have disconnected your LED make sure the orange wire is going to the terminal on the LED that has the red positive mark next to it. Whenever the “Empty” LED is “ON” the validator is disabled and it will no longer accept bills.

1. Turn OFF the power on the main logic board.
2. Pour the coins into the large opening in the funnel on the top. There must be at least enough coins to cover the two gold plates at the bottom of the hoppers. (Somewhere between 160 and 17,000 coins minimum to maximum.)
3. Turn “ON” the power switch. The “Empty” LED is now off and the bill validator is ready to accept bills.

USING THE DUMP MODE TO EMPTY THE HOPPERS

1. Open the cabinet door.
2. Turn OFF the POWER switch.
3. Place a suitable container in front of the hoppers to catch the coins.
4. Press and hold the “DUMP” button on the upper right corner of the Main Logic Board. Turn ON the Power switch. The red LED numbers on the main logic board will come on all “88888’s” then go all “00000’s”. Once the red “00000’s” light up, release the “DUMP” button. If it is not released within two seconds, the “DUMP” mode is canceled as a security feature.
5. The hoppers will dispense coins until the POWER switch is turned OFF. If the red LED numbers are not counting up rapidly on the Main Logic Board’s display the dump mode was not accessed. Please try again.

THE DIP SWITCHES

The AC6000-6001 series changer is capable of dispensing coins in different pay out modes. Setting the coins out per dollar is controlled by which Dipswitches turned “ON.” (Refer to figure 1 for their location.) For example, switch #2 is “ON” on both dipswitches; therefore the payout equals 4 coins per dollar. Two coins per hopper for one dollar.

NOTE: The only way to get a duplicate set of keys made is to save the red tag that comes between the keys. This ID # starts with “ACC ####”.
Write your Key # here “ACC__________”. ALL KEY ORDERS TAKE 4-6 WEEKS!!!
ALL CALCULATIONS ARE BASED ON THE TOTAL COINS YOU SET FOR THE $1.00 BILL

For Mode #8, disregard the $ sign. (i.e. 2-2 = 2 tokens not 22 in tokens.)

THE FOLLOWING BONUS OPTIONS ARE CONTROLLED BY THE RIGHT DIP SWITCH ONLY!!

"NO" MEANS "NO BONUS" FOR THIS BILL.

C IS DIPSWITCH "ON"
HOW TO USE THE BONUS TABLE
Think of the bonus table as the total amount of EXTRA tokens after the regular payout, that you wish to receive:
EXAMPLE: PAYOUT: 4 tokens for $1, 24 for a $5, 52 for a $10, 120 for a $20.
24 tokens = $1 extra in tokens
52 tokens = $3 extra in tokens
120 tokens = $10 extra in tokens.
Now go to the bonus table, find where the $5 column = $1
Look over to the $10 and go down until you see $3.
Finally go to the $20 column to where = $10.
You should be at 1-3-7; Turn “ON” your right dipswitches 1-3-7 to set this payout.

DIPSWITCHES
The following table shows how to set the dip switches to your desired payout.

<table>
<thead>
<tr>
<th>“ON”</th>
<th>COINS PER DOLLAR</th>
</tr>
</thead>
<tbody>
<tr>
<td>#1</td>
<td>1</td>
</tr>
<tr>
<td>#2</td>
<td>2</td>
</tr>
<tr>
<td>#3</td>
<td>4</td>
</tr>
<tr>
<td>#4</td>
<td>8</td>
</tr>
</tbody>
</table>

The left dipswitch controls the left hopper’s pay out and the right dipswitch controls the right hopper’s pay out.
Refer to the next table to set up your changer for the settings you need.

MODE DESCRIPTIONS
Some of the modes are self-explanatory while others have sub modes built into the chip. Here is a list of the modes and sub modes when applicable.

MODE 2 - $1 coins the balance in quarters:
The quarters for each bill are controlled by the sub mode settings of the right dipswitches #1 & #2.
Neither “ON” – 16 Quarters balance in $1 coins.
#1 “ON” only – 8 Quarters balance in $1 coins.
#2 “ON” only – 12 Quarters balance in $1 coins.
#1 & #2 “ON” – 4 Quarters balance in $1 coins.

MODES’ #5 & #11 – Setting right dips in “$1 increments”:
Refer to Page 6 Under “Dipswitches Con’t”. But instead of counting up in coins, think of it as dollars.

MODE #14 – Canadian $1 & $2 coin payout:
The right dipswitches #1 & #2 can alter the amount of $1 coins given to each denomination.
Luni’s per $: $5  $10  $20
Neither “ON” - 1L  0L  0L
#1 “ON”  3L  2L  2L
#2 “ON”  3L  4L  4L
The machine will always give 2 Luni’s for a Tuni.

Another way to look at the Bonus pay out mode is as follows:
The bonus is paid out by the amount of tokens given for a dollar. For the below explanation we will say you are giving 4 tokens per dollar. Left dips #3-#6-#7 is ON.

Right DipSwitch
For a $5.00 bonus payout: #1 #2
20 tokens + no bonus OFF OFF
20 tokens + 4 extra tokens ON OFF
20 tokens + 8 extra tokens OFF ON
20 tokens + 12 extra tokens ON ON
For the $10.00 bonus pay first double the pay out for the $5 bill. So if the total tokens given for the $5 bill was 24, the pay out for the $10 bill is 48 tokens. Now let’s figure out the bonus for the $10 bill.

Right DipSwitch
For a $10.00 bonus payout: #3 #4
$5 pay out + no bonus OFF OFF
$5 pay out + 4 extra tokens ON OFF
$5 pay out + 8 extra tokens OFF ON
$5 pay out + 12 extra tokens ON ON

Right DipSwitch
For a $20.00 bonus payout: #5 #6 #7
$10 pay out + no bonus OFF OFF OFF
$10 pay out + 4 extra tokens ON OFF OFF
$10 pay out + 8 extra tokens OFF ON OFF
$10 pay out + 16 extra tokens ON ON ON
$10 pay out + 20 extra tokens OFF ON ON
$10 pay out + 24 extra tokens ON ON ON
The following table shows how to set the dip switches to your desired payout.

<table>
<thead>
<tr>
<th>“ON”</th>
<th>COINS PER DOLLAR</th>
</tr>
</thead>
<tbody>
<tr>
<td>#1</td>
<td>1</td>
</tr>
<tr>
<td>#2</td>
<td>2</td>
</tr>
<tr>
<td>#3</td>
<td>4</td>
</tr>
<tr>
<td>#4</td>
<td>8</td>
</tr>
</tbody>
</table>

If you want to dispense 5 dimes and 2 quarters per dollar turn “ON” switches #2 on the left and #1 and #3 on the right dip switch. (2 quarters + 5 dimes = $1.00)

The left DipSwitch controls the left hopper’s pay out and the right DipSwitch controls the right hopper’s pay out.
Refer to the next table to set up your changer for the settings you need.
**FUSE**

**Low voltage fuse:** This is the secondary transformer fuse for the 5 - 28 VDC sections of the main logic board and hoppers. It is located to the left of the transformer. (See fig. 1) Replace this fuse with a 2-½ amp AS fuse only. **REPLACING THIS FUSE WITH ANYTHING OTHER THAN A 2 ½ AMP “AS” MAY RESULT IN A FIRE OR AN UNSAFE WORKING CONDITION!!**

**Indicator Lights**

**Main Logic Board:**
1. Green LED on: AC power applied to the logic board. All fuses are good.
2. Decimal Point:
   A. Heartbeat - 5 and 12vdc present. The changer is in standby waiting for a bill pulse.
   B. On Steady - Out of service, Hopper error detected.

**Validator logic board:**
1. Red LED
   A. On Steady - Standby Mode, waiting for bill insertion.
   B. Flashing - Error mode, go to page for error code information.
   C. Off - The changer “Empty” LED is lit.

**Coin Control Hopper MKIV**
Three green LED indicators are fitted on the hoppers and are visible in the section where the coins exit the hoppers. From left to right these are designated as follows:

1. Logic power supply on (12 & 24vdc present).
2. Security optical obstruction indicator -. Should be "on" when unit is OK.
3. Output indicator, indicates coin passing photo-sensor. This is the optical sensor the coin will obstruct on its way out of the hoppers. For normal operation LED # 3 will be off until coins are dispensed.

**LOGIC BOARD ERROR CODES**

We now have the ability to display error codes in dealing with the problems associated with the changer. There are 2 different locations error codes can be displayed depending on the source of the problem.

If the “Empty” LED on the outside of the changer is lit:
1. Press and hold in the “Dump” button on the main logic board.
2. The display now shows the code for your problem.

**Coin/Token Sizes**
The hoppers will automatically adjust to dispense coins/tokens in size from 20-30 mm in diameter and 1.25 - 3.5 mm in thickness.

There is an option available to dispense smaller coins. A nickel is approximately 21 mm, a quarter is approximately 25mm. A Susan B. Anthony is 28mm.

**Error Codes:**
- **01** = Low Coin
- **02** = Coin exit window is blocked
- **04** = Under-payment was detected
- **10** = Over-payment was detected and Prevented. (Jackpot condition)

A “03” error code is a low coin and exit blocked in the same hopper.
AC6065 AUDIT BOARD FUNCTIONS
The audit board is mounted to the back of the AC6000/1 door and was made to give a visual breakdown of audit counts for individual counts on: quarters, ones, fives, tens and twenties.

By pressing the button associated with the counter on the audit board the display will change from an exact dollar/change reading accepted by the changer to the individual counter accepted by each denomination. I.e. if you were to press the “quarter” button and “132” were to be displayed, that would mean the machine had accepted 132 quarters or $33.00 in quarters.

To reset the counters to zero press and release the two outside buttons (quarters + $20) simultaneously. After the NEXT bill is inserted the counter is reset to zero!
THE (AC7070) PRINTER OPTION UPGRADE
Installation & programming instructions

SECTION A. – General Information

*All AC7070 Printer Boards (PB) are year 2000 compliant.*

**FAST FACTS:**

1. Replace battery every 2-years with a 3V-Lithium #CR2320, Positive side UP. It is a very common battery and can be found just about everywhere, even Radio Shack. Replace battery with the power on so not to lose the existing programming.

2. Replace paper with:
   - A. Nippon TP50KS-E2C or TP50KS-A
   - B. Honshu FH65BU-2 or FH65BX-14N
   - C. Mitsubishi F-200U9W3 or F-200U7N5

   Using any other paper than the type specified will dramatically cut down the life of the printer. Office Depot should carry at least one of these paper types.

3. Change the paper with power on at the printer board. Feed the paper into the back of the printer until it stops. Press and hold the #3 paper feed button until the paper comes into view.

4. The dial in the lower right corner of the print board is to set print contrast. DO NOT MAKE THE CONTRAST to dark. It will cause the print head to burn up. It should be set to be just legible.

5. THE PRINTER IS MAINTENANCE FREE!!! Do not try to mechanically adjust, lubricate or pry on the printer. ANY PRINTER MAINTENANCE VOIDS THE WARRANTY!!! Blowing the dust out of the printer with canned air every 6-monthes is recommended and required by the warranty.

SECTION B. – Installation

**INSTALLATION OF THE AC7070 PRINTER BOARD ON INDIVIDUAL MACHINES.**

If the Printer was installed at the factory skip to Section C

1. Remove power from the machine.
2. Remove the hoppers from the machine.
3. Remove the hopper plates and disconnect the harnesses from the Main Logic Board.
4. Remove the original validator harness.
5. Install the new plates and connect the harnesses to the Main Logic Board. (Right plate to the bottom hopper connector.)
6. Make sure the inside left wall of the AC2000 series cabinet is free of dirt and oil.
7. Peel the covers off the 4 stick pads at each corner of the board.
8. Attach the board firmly onto the side of the cabinet by pressing firmly in each of the Four Corners of the board simultaneously.
9. Connect the RIBBON CABLE to the AC2000 series on the Printer Board.
10. Attach the RIBBON CABLE to the pigtail of the hopper plates.
11. Attach the new validator harness. Connect it to the lower plug on the Main Logic board, the Empty LED, and to the Bottom Connector #2 on the Printer Board.
12. Reinstall the hoppers onto the hopper plates.

Section C. – Printout Description.

DESCRIPTION OF THE PRINTER’S PRINT-OUT
When you first receive your Printer, you will see a printout on the tape sticking out of the Printer. Below is the description line by line:

Machine # - This will be programmed by the user later. It is the programmable number designation assigned for this machine.
Sequence # - This is the audit number assigned to the receipt. The printer will print out 2 receipts per sequence.
Date & Time - Date and time the printout occurred.
Quarters through Hundreds - The amount of each currency accepted since the printer was last reset.
Sum - The amount in dollars the printer has accumulated since it was last reset.
Total - The amount in dollars the printer has accumulated in it’s lifetime. THIS TOTAL CAN NEVER BE RESET!!
Hopper 1 & Hopper 2 - The amount of coins given out of each hopper since the printer was last reset. In a 1-hopper machine only, Hopper 1 will accumulate.

THE DENOMINATIONS AT THE BOTTOM OF THE PRINTOUT REPRESENT THE LAST 3 BILLS ACCEPTED BY THE BILL ACCEPTOR(S).

Section D. – Programming the Printer.

How to Program the AC7070 Printer Option
There are 4 programming modes associated with the Printer: Machine #, Time, Date, and the ability to make the "SUM" on the printer printout resetable or non-resetable.

To enter the programming mode, turn the main logic board of the machine off. Press and hold down the #2 & #3 while turning on power to the main logic board. Release the #2 & #3 pushbuttons as soon as the printer head move, (Approx. 1 second)... The Printer prints out "*****Set up Mode*****" and you’re ready to start! Now that we’re in the set up mode let’s press #1 to set machine number. This number represents this machine. This way if you have multiple printers and receipts scattered on your desk, the machine number will tell you which machine the receipt is for. This number has three digits. Right now the machine is number “000”. Follow the directions on the printout. Every time you press the # button the red light will flash and the digit associated with that digit counts up by one. DO NOT RUSH!!! IF YOU DID NOT SEE THE RED LIGHT ON THE PRINTER BOARD FLASH YOU COUNT DID NOT INCREMENT!!! If you made a mistake, press OK (#4), then #2 to restart the operation. For a sample we’ll assign #358 as our machine number.

1. Press the #1 button 3 times to set the “hundred’s” digit. (Try to press once per second. This is a good rhythm. Ensure the red light on the printer board also flashed three times.)
2. Press the #2 button five times to set the “ten’s” digit.
3. Press the #3 button 8 times to set the “one’s” digit.
4. Press #4 OK. (If the printer does not show the desired machine number press #2, and go back to step #1)
5. Press #4.

The printer will now print a receipt showing the new machine number at the top of the paper.

Time – Reenter the program mode and this time press #2 for the 24-hour clock. In the sample below I will use 9:52 AM. (For those of you unfamiliar with this type of time setting here is a sample. 1:00 AM = 0100 hours, Noon = 1200 hours, 1:00 PM = 1300 hours, 6:00 PM = 1800 hours, Midnight = 0000 hours.)

1. Press #3 for the TENS setting on the 24-hour clock. (Since the sample time is 9:52 AM or 0952 hours DO NOT PRESS #3. Just hit #4 to move on.)
2. Press #3 9 times to set the hour, then press #4.
3. Press #3 5 times to set the hour, then press #4.
4. Press #3 2 times to set the hour, then press #4.
5. Press #4 OK. (If the printer does not show the desired machine number press #2, and go back to step #1).

The printer will now print a receipt showing the new time at the top of the paper.

Date – Reenter the program mode. The sample will be May 15th 2000.

1. Press #3 for the date mode.
2. Press #2 for 2000 then press enter.
3. The printout shows 2000, if it is correct press #4.
4. Press #4 for the “ten’s” digit of the year.
5. Press #3 to set the “one’s” digit of the year. For the example press #3 2 times.
6. The printer now shows the completed year., if it is correct press #4.
7. To set the month “ten’s” digit press #3. In the example the month is ‘05’ so press #4.
8. Set the "one's" digit of the month, in the example press #3 5 times. Press #4.
9. Press #4 if printout matches the month.
10. Set the "ten's" digit of the date by pressing #3.
11. Press #3 to set the "one's" digit of the date.
12. Press #4 if date printout is correct.

The printer will now print a receipt showing the new date at the top of the paper.

Resetable Counter – This feature either locks the "Sum" total on the printout, or allows it to be reset each time you increment the sequence number.
1. Enter the program mode.
2. Press #4.
3. Locked – YES or NO.

The printer will now print a receipt.

Section E. – Printer Operation
The Printer operation is fairly simplistic. The Printer gets its input pulses from the bill validator and sorts them into the categories such as "quarters" and "twenties". For the "hopper" category, each hopper's exit window is monitored and each coin is counted as it's dispensed.

Using the Printer – Once installed the printer should be used as any normal accounting device. THE PRINTER WILL NOT LOSE ANY ACCOUNTING INFORMATION WHEN POWER IS LOST! A printout can be obtained by pressing the "PRINT" (#2) button. This action will not reset the accounting features. It is a monitoring printout only! Another helpful feature of the Printer is the printout of the printer's exit window is monitored and each coin is counted as it's dispensed.

Every accounting period the Printer will need to dump it's information and start over. This is accomplished by pressing the #1 and #4 buttons simultaneously. The printout will have *Reset Count Receipt* at the top. There are 2 receipts printed, then the counters are reset to 0.

THE "TOTAL" COUNT CAN NEVER BE RESET!!!

(End Printer Description Section)

Functional Description of the Series AC6000-6003 Changer
To follow along with this walk-through of your changer, fill the hoppers with coins and turn the changer on.

1. When power is applied the validator will cycle twice, the out-of-service LED flashes then goes out, the green LED on the main logic board comes on steady, and the decimal point on the main logic board number display will flicker on once per second in the standby mode.
2. During the power-up mode the main logic board relay clicks twice enabling power (120vac) to the validator. When this relay is not enabled it routes 12vdc ground to the out-of-service LED. Without power to the validator the changer cannot accept bills. Since we are not in the error mode, the red LED on the validator logic board is on steady.
3. When a bill is inserted into the validator bill slot, the bill will be pulled inside. The validator then compares what the bill looks like to its memory. After the bill is validated it grounds the 5vdc lines causing a pulse along the yellow and blue validator harness wires to pins 5 and 15 of the main logic board. Each pulse stands for the amount of the denomination validated. (i.e. 1 pulse for $1, 5 pulses for $5).
4. The 5vdc pulse then travels from pins 5 and 15 to the EPROM chip (DBCG-1) pin #25. The EPROM sends a 12vdc pulse to the meter chip (U5) out pins #21 & 22 (one pulse per denomination validated). The EPROM also multiplies the bill pulse by the DipSwitch settings (The EPROM reads the DipSwitch settings during the power up mode and stores them into memory.)
5. The EPROM then sends the hopper pulses out pin #23 to pins 6 and 7 of the red 12 pin hopper plugs. These pulses travel through the purple and brown wires of the hopper wire harness to the hoppers pins 8 and 12.
6. The hopper turns itself on with the first hopper pulse. The hoppers counts the hoppers pulses sent from the EPROM chip on IN3 (pin 12) while dispensing the coins at the same time. When the amount of hoppers pulses in equals the coins dispensed through the coin counting optical sensor the hopper turns itself off.
7. The Changer returns to the standby mode with the decimal point flashing once per second until another bill is inserted.

NOTE: THE METER ON THE MAIN LOGIC BOARD CANNOT BE RESET TO ZERO!!!

Functional Descriptions of Out-of-Service Conditions

Out-of-Service conditions occur for the Series AC6000-6002 changer for the following reasons: low coins, hopper fault error, validator fault, or a blown fuse.

1. Blown Fuse: an AC power spike in line voltage or a bad transformer on the main logic board can cause a blown fuse on the main logic board. If either fuse blows the indication is the green LED on the main logic board will not light.
   A. Replace the fuse. If the green LED now lights then there was a spike.
   B. If it does not and the fuse blows again the power transformer is shorted. To test the transformer use a voltmeter set for ohms and measure across the primary (40ohms) and the secondary (1.5ohms).

2. Hopper Fault: A hopper fault can either be a jammed hopper, a blocked coin counting optic or a bad hopper logic board.
   A. Indications for a jammed hopper are the changer accepts bills, the meter counts up, but nothing or not enough coins are paid out.
   1. After 2 minutes the EPROM shuts off the validator if the coins are not paid out correctly. The “Empty” LED will flash once per second.
   2. At this point the three options open are to attempt repair on your own, call your distributor, or return the defective hopper to American Changer.
   B. Indications for a blocked coin optic or bad hopper logic board are the out-of-service LED on the
outside of the changer is lit and the red LED on the main logic board is lit and flickers off once per second.

1. If two of the 3 green LED’s on hopper logic board are lit then the hopper logic board is bad.
2. If there is a coin or foreign object caught in the coin exit window LED’s #1 and #3 will be lit on the hopper logic board instead of LED’s #1 and #2.
   a. Take off the side of the hopper with the 5 Philips screws. Pull up on the exit window logic board and look for the jammed item.
   b. Ensure you have the pins aligned before reconnecting logic board.

3. Validator Fault: When a validator fault occurs the validator’s EPROM shuts down the validator and flashes an error code via the red LED on the validator logic board. When there is no error this LED is on steady. The validator only gives bill pulses to the main logic board so the main board never knows if the validator isn’t functioning. Therefore the out-of-service-LED will not light. (See page 7 for validator error codes.)

4. Low Coins: The low coin condition is probably the most common fault. The EPROM on the main logic board is constantly checking for low coins in the hoppers. This is done with a low current 5vdc signal on pin #3 of the hopper’s output connector. The voltage then travels down the hopper’s wire harness on the white wire to pin #7 of hopper’s plug. The signal is applied to one of the gold low contact plates at the bottom of the hoppers. The 5v travels through the coins through the other contact gold plate to hopper’s pin #2. It then goes through the black wire in the hopper’s harness to pin #10 on the main logic board. Any interruption of more than 1/2 a second will cause an out-of-service condition.
   A. Clean the bottom gold plates of the hoppers with steel wool or fine sandpaper. Refill the hoppers and try again.
   B. Check continuity, (0 ohms) resistance, from pins 3 (white) and 10 (black) of the red hopper harnesses. Make sure both hoppers are full and the changer is turned off.
      1. If the continuity is 0 ohms, replace the main logic board.
   C. Pull the hoppers out of the changer, then look at the 12 pin black male connector that sticks out of the hoppers. Place the continuity checker’s leads on pins 2 & 7.
      1. If the continuity is 0 ohms, replace that hopper’s plate or adjust the hopper’s plate female socket’s pins so that they are not so spread out.
      2. If the continuity is infinity, then replace that hopper.

WIRE HARNESS COLOR AND DEFINITIONS

**Validator harness:**
- Red - Switched Hot 120VAC.
- White - Neutral 120VAC.
- Black - 120VAC Low current validator enable.
- Yellow - +5vdc credit pulse line.
- Blue - -5vdc credit pulse line.
- Orange - +12vdc Empty LED.
- Brown - -12vdc Empty LED.

**Hopper Harness**
- Gray - Coin counting optic status line.
- White - Low coin sense (+5vdc).
- Green - Coin counting optic pay out feedback line.
- Yellow - Raw sensor output line.
- Purple - Hopper pay out line from main logic board (+),
- Brown - Hopper pay out line from main logic board (-).
- Red - +12vdc logic board supply voltage.
- Black(s) - 12v, 24v low coin sense ground.
- Orange - +24vdc Motor supply voltage.

Converting CoinCo to MARS AE2601’s

*Machines made after September 2002* (Serial # 02366-------)

To convert these machines first ensure the correct harnesses have been ordered. *(Part # AC1061.1-4H = Validator Left Harness, AC2062.1-2H + AC2066.3-1H = Right Validator Harness + Condor Coin Mech Adapter (if required)).*

1. Remove Power & the Factory Harnesses.
2. Remove the CoinCo’s.
3. Loosen the 4 nuts on the door & slide the right side door validator bracket to the lowest position then retighten.
4. Install Right MARS Validator.
5. On the left side folding validator bracket, flip the bracket forward & remove the 2 adjustment screws from behind. Place the bracket on its lower setting and re-install the screws and tighten.
6. Install the left MARS.
7. Install both wire harnesses. Ensure you plug the Door Mars validator to the left side Audit or TOP printer connection and the Flip bracket Mars to the right side Audit or BOTTOM printer connection.
8. Set page 24 to set the DipSwitches.

Condor Electronic Coin Mech. Programming

The next page will teach you how to program the Condor.

If you have an AC6000 Program the $1 coin in the #1 Slot. You can not accept Quarters and dollar coins with out a new wire harness.

If you have a AC6001 or AC6003, program the Quarter into the #1 slot and the dollar coin in the #4 slot.
To Teach and Run a coin or token into Condor follow this procedure:

1. To start with the LED should be lit green and the rotary switch in position 0.

2. Using a small flathead screwdriver turn the rotary switch to position 1 (or 1 to 6 for multi coin Condors) and press the programming button. The LED should change to red.

3. Feed a selection of the coin to be taught into the acceptor until the LED begins to flash green (this typically happens after 4 coins). Press the programming button once more.

4. The LED should return to green. Turn the rotary switch back to 0. The acceptor is now ready to accept coins.

CoinCo MAGPRO Series Flash Codes

Flash codes 1-18 may appear during normal servicing of the BA30. If more than one error or condition exists, the lower number flash code will appear until its respective error or condition is corrected. The left and right sensors referenced below are given viewing the BA30 from the front.

CLEANING THE BILL VALIDATOR

Refer to the pictures and the procedure on the next page to clean the bill validator every 4-6 months.
MAGPRO CLEANING: IF ANY OF THESE PROCEDURES ARE PERFORMED TO YOUR VALIDATOR AFTER IT IS
RETURNED UNDER A WARRANTY REPLACEMENT, YOU WILL BE SUBJECTED TO A $65.00 LABOR FEE.

CLEANING AND MAINTENANCE:
Note: Petroleum-based cleaners and freon-based propellants can damage plastic and some electronic components. Scouring pads and stiff brushes may harm the protective conformal coating on the circuit boards and can mar the plastic. These items should never be used when cleaning the MAGPRO bill acceptor.

The MAGPRO should be cleaned every 7,000 bills or every 4 - 6 months (or as needed, depending on the environmental conditions of the location). Dust can be removed with a soft brush or cloth or it can be blown out using compressed air.

Procedure:
1. Disconnect power from the bill acceptor.
2. Remove the bill box and use a soft cloth to wipe the dust from around the intermediate frame and stacker plate.
3. Remove the lower track.
4. Using compressed air or a soft brush, blow or brush the dust off of the optic sensors and out of the recessed sensor openings.
5. Remove dust from around the belts and wheels on the lower housing and the sensors on the upper sensor board. The upper sensors are located directly above the lower housing sensor when the lower housing is installed.
6. The bill path can be cleaned to remove further dirt and oil using a soft cloth moistened with a mild soap and water solution.
7. Clean the magnetic head using a swab and isopropyl alcohol.
8. Once the lower housing is dry, place it back into the mainframe so that the tab on the bottom locks into place.
9. Blow the dust out of the encoder wheel and its sensors. (It may be necessary to extend the stacker plate to access the encoder wheel. Supplying power to the unit momentarily can do this, so that the stacker plate extends.)
10. Remove dust from the transport belt areas and from any other places of build up.
11. Remount the bill box.
12. Apply power and insert bills to verify that the unit is functioning properly.

MAGPRO CLEANING PROCEDURE FOR SALT WATER POLLUTED UNITS:
Note: Petroleum-based cleaners and freon-based propellants can damage plastic and some electronic components. Scouring pads and stiff brushes may harm the protective conformal coating on the circuit boards and can mar the plastic. These items should never be used when cleaning the BA30 bill acceptor.

Procedure:
1. Remove power from the bill acceptor.
2. Remove the bill acceptor from the vending machine.
3. Open the bill box lid and verify that the stacker plate is in the stand-by/home position. If it is not in the home position, apply power and observe that the stacker plate returns home.
4. Remove the lower housing.
5. Remove the bottom cover from the lower housing.
6. Run hot water (1101/4-1401/4F) over the lower housing from the top and bottom. Using a soft brush, gently clean any residual salt. Use a soft absorbent cloth to clean any residue off the lower housing. If the transformer gets wet, allow the unit to dry for 24 hours before applying power.
7. Remove the front mask. Using hot water and a soft brush, clean the front mask, upper sensor board, main frame anti-pullback levers and position sensor mount.
8. Replace the lower housing cover.
9. Verify that the anti-pullback levers move freely and that the spring returns them to their open position.
10. Allow the unit to dry thoroughly.
11. Clean the magnetic head using a swab and isopropyl alcohol.
12. Replace the front mask
13. Replace the lower housing cover.
14. Replace the lower housing into the main frame.
15. Remount the bill box.
16. Apply power and insert bills to verify that the unit is functioning properly.

6 OR 7 ERROR CODE FLASHES
The cleaning procedure for this common occurrence is listed below. Just follow these steps.
1. If this code has occurred on a new machine or one that the validators DIP switches were just changed, Ensure that all the white plugs on the side of the validator board away from the red LED are plugged in securely.
2. Remove the bill box.
3. Turn the Changer ON then OFF in an attempt to stop the metal push plate so that it COASTS into the fully outward position.
4. Using an air compressor or a can of compressed air blow out the area behind the push plate until it is completely free of all dust and lint.
5. Turn the changer power back on so that the push plate returns to the inward position. If the same error code persists, repeat steps 1 - 3 concentrating on the top center area behind the plate.
6. Replace the bill box.
Every 2-3 years the belts on the CoinCo will wear out. To replace them, remove the validator components down to the picture show. Refer to the parts diagram at the end of the manual for help getting to this point.
In order to use the Mars type VN2611 type validator the door must be changed out to the "UNIVERSAL style" with the large cut out openings.

This is not a problem when using the Mars VN2601 style validator!

See Page 13 for instructions to convert from CoinCo to Mars AE2601.
Removing the bill box

1. Push bill box up and out.
2. Push BLUE button forward.

Clearing A Bill Jam

1. Pull up on silver bar (Rod)
2. Pull bar away from the Mars.

* Switch 3 affects all denominations. See Coupon Configuration on page xx for individual acceptance/security enabling options.

** The AE2600 defaults to short pulse.
Cleaning & Maintenance

Cleaning
You can clean the bill acceptor while it is still mounted in the machine.
1. Remove power from the machine.
2. Unlatch the magazine by pushing the blue latch (located on the top of the unit) toward the front of the unit.
3. Unhook and remove the magazine by holding the latch and lifting up and then back on the magazine.
4. Unlatch the LED Housing by lifting up on the metal bar (located below the Status LED).
5. Remove the LED Housing by holding the metal bar and pulling back on the LED Housing.
6. Clean the bill path with a soft cloth. You may use mild, non-abrasive, non-petroleum based cleaners if sprayed on the cloth.
Coupon Configuration

The AE2601 may be configured using a coupon. The coupon is included in the AE2601 Series Installation Guide. Carefully cut the coupon along the dotted-line edge to remove it from the installation guide. Copies of the original coupon may be produced with a standard, carbon-based, non-color copier. Cut copies to match the size of the original coupon.

All option switches must be in the OFF position for the coupon selections to be active.
The coupon selection will remain with the AE2601 until the unit is reprogrammed, even if power is removed.
When filling out the coupon, note the following:
Use only a #2 pencil to fill in the blocks
Fill in the entire block
Do not mark the coupon outside the blocks or on the back of the coupon
Fill in ONE block for EVERY line

Coupon Programming
1. Fill out the coupon using the table below.
2. Locate the service button on the back of the unit (refer to Figure 2).
3. Press the button once to enter the coupon setup mode. Pressing again will exit the mode. The unit will automatically exit coupon setup mode upon acceptance of the coupon configuration.
The LED Status indicator (located to the left of the service button) will flash rapidly indicating that the unit is in coupon setup mode.
4. Insert the coupon marked-side up.
The AE2601 will pull the coupon in, read it, and then return it to the user.
A good coupon will be returned immediately. After the coupon is pulled from the bill acceptor mouth, the unit will flash the Status LED ten times to confirm a good configuration.
A bad coupon will be held for ten seconds before being returned. This delay is to make you aware that there is a problem with the coupon. When the coupon is pulled from the bill acceptor mouth, the unit will flash the Status LED the number of times corresponding to the section of the coupon wherein a problem lies. For example, if the problem is in section five, the LED will flash five times. Section numbers are located to the far right of each section on the coupon.
5. If the configuration is rejected, check the coupon and repeat the process.
### Trouble Codes

**Status LED**

A Status LED provides assistance in diagnosing the condition of the Series AE2600. The following is a description of the LED codes, their meanings, and suggested remedial actions.

**LED ON** - Indicates that the unit is enabled and ready to accept a bill.

*No action is necessary.*

**LED OFF** - Indicates that no power has been applied to the unit.

*Check to ensure that power is applied.*

**1 Flash** - Indicates that something is obstructing the bill path.

*Remove the magazine and LED housing; inspect for foreign material.*

**2 Flashes** - Indicates that the unit is not enabled.

*Verify configuration. Check the dipswitches.*

**3 Flashes** - Indicates that the bill path needs cleaning for optimum performance.

*Remove the magazine and LED housing and follow cleaning instructions (page 22) to clean the bill path.*

**4 Flashes** - Indicates that something is obstructing the bill path.

*Remove the LED housing and look at the bill path on the housing and inside the unit for foreign material; clean as necessary.*

**5 Flashes** - Indicates that the magazine is removed (the unit will not accept without the magazine attached).

*Reinstall the magazine.*

**Continuous Slow** - Unit is defective.

*Replace the unit.*

**Continuous Fast** - The magazine is full of money.

*Remove the money from the magazine.*

---

**3 Flashes** - Indicates that the bill path needs cleaning for optimum performance. *Remove the magazine and LED housing and follow cleaning instructions (page 22) to clean the bill path.*

**4 Flashes** - Indicates that something is obstructing the bill path. *Remove the LED housing and look at the bill path on the housing and inside the unit for foreign material; clean as necessary.*

**5 Flashes** - Indicates that the magazine is removed (the unit will not accept without the magazine attached). *Reinstall the magazine.*

**Continuous Slow** - Unit is defective. *Replace the unit.*

**Continuous Fast** - The magazine is full of money. *Remove the money from the magazine.*
MKIV UNIVERSAL HOPPER

INDEX PAGE

1. Coin box removal & reassemble 29-31
2. Exit window replacement 30
3. Logic board replacement 31
4. End plate removal 31
5. Track plate removal 32
5a. Track plate assembly 32
5b. Track plate replacement 33
5c. Final drive gear replacement 33
6. Gearbox assembly 34
7. Motor replacement 34

To un-jam the hopper, refer to sections 4 – 5b, pages 31 – 33.
1. COIN BOX REMOVAL

1. Place the hopper in front of you as shown, (looking at the outside of the ‘coin box’).

   Refer to FIG 1.

2. Remove the 2 locking nuts, which hold the ‘low level sense plate’ wires to the studs.

3. Remove the crimp & wire from the studs.

4. Remove the 5 screws indicated (B), which hold the ‘coin box’ to the ‘center plate’.

   Refer to FIG 1a.

5. Gently lift the ‘coin box’ away from the rest of the hopper.

   NOTE:- The ‘logic board’ & ‘stirrer’ are located in the ‘coin box’.

6. As the ‘coin box’ is being removed, carefully slide the ‘logic board’ out. The stirrer may stay with the ‘coin box’ or fall onto the center plate.

1a. COIN BOX ASSEMBLY

1. Firstly, locate the ‘stirrer in the ‘coin box as shown in FIG 12.
COIN BOX ASSEMBLY (cont.)

2. Line up the ‘centre plate’ & ‘coin box’ as shown below. FIG 12a.

3. Route the ribbon cable as shown below.

4. Fit the ‘logic board’ into slots shown below.

5. Feed the level sense wires through the slot shown below.

6. Lift the ‘centre plate’ to meet the ‘coin box’. FIG 12b & c.

7. Align the ‘center plate’ & ‘coin box’ & push together.

8. Turn the hopper over & refit the screws.

9. Refit the level sense wires.

2. EXIT WINDOW REPLACEMENT

1. First, remove the ‘coin box’, section 1. **This will then enable access to the ‘exit window’**

2. Unscrew & remove the 2 fixing screws. FIG 4.

3. Remove the ‘exit window’ from the ‘center plate’.

4. Unclip & remove the 10-way ribbon cable header.

5. To re-assemble, follow the above steps in reverse.
3. LOGIC BOARD REPLACEMENT

1. First, remove the ‘coin box’, section 1.

   *This will then enable access to the ‘logic board’.*

![FIG 5.](image)

   10-way ribbon IDC socket (CONN 1).

2. Move the two ejector arms at right angles to & away from the connector, if fitted.
3. This should release the socket from the header.
4. Clasping the connector between thumb & forefinger, pull away from pin header.
   14-way crimp socket (CONN 2).
5. Gently, unclip the “friction lock” from the connector housing.
6. Clasping the connector between thumb & forefinger, pull away from pin header.
7. The Logic Board is now released.
8. To re-assemble, follow the above steps in reverse.

4. END PLATE REMOVAL

1. Place the hopper in front of you as shown, (looking at the outside of the ‘end plate’).

   Refer to FIG 6.

![FIG 6.](image)

2. Remove the 9 screws indicated (B), which hold the ‘end plate’ to the ‘center plate’.
3. Locate the position of the ‘connector blanking piece’.
4. Holding the ‘connector blanking plate’ gently lift the ‘end plate’ away from the rest of the hopper.

5. TRACK PLATE REMOVAL

1. First, remove the ‘end plate’, section 6.

   See FIG 7.

2. The ‘elevator track’ & ‘final drive gear’ can now be removed by lifting up & away from the ‘center plate’.

![FIG 7.](image)
5a. TRACK PLATE ASSEMBLY

The following 3 sketches show how to take the ‘track plate’ apart.

1. \hspace{1cm} 2. \hspace{1cm} 3.

The following 3 sketches show how to assemble the ‘track plate’.

4. \hspace{1cm} 5. \hspace{1cm} 6.
5b. TRACK PLATE REPLACEMENT
1. The gray shaded area, in FIG 7b, is the ‘track plate’ guide path.

2. Once the ‘track plate’ is in position, turn the track through $720^\circ$ to ensure it is seated in the guide path correctly.

5c. FINAL DRIVE GEAR REPLACEMENT
1. Once the ‘elevator track’ is in place, the ‘final drive gear’ can be fitted by placing the gear over its mounting spindle, while lining the teeth up with the secondary drive gear, adjust the ‘elevator track’ so that the gear falls into place. FIG 7c.
2. The end plate can now be re-fitted. See section 6.
6. GEAR BOX ASSEMBLY

1. Remove the end plate. Section 6.

2. Remove the ‘elevator track’ & ‘final drive gear’. Section 7.

3. Remove the gearbox cover. Section 8.

4. Remove the gears in the order as shown in FIG 9.

Access to the motor fixing screws is now possible.

5. To re-assemble, follow the above steps in reverse.

FIG 9.

7. MOTOR REPLACEMENT

1. Remove the ‘coin box’. Section 1.

2. Unsolder the red & black wires from the motor.

NOTE: The black wire connects to the terminal marked with a RED dot.

5. Remove the gearbox cover. Section 8.

7. Unscrew the 2 motor fixing screws. FIG 10.

8. To re-assemble, follow the above steps in reverse.

FIG 10
NOTE: Before starting this procedure ensure the changer is plugged in, the ON/OFF switch is on, the hoppers are full of coins, and all wire harnesses are connected securely and correctly. The wires exiting the red connectors should point away from the board!!

Start here!

1. Is the "EMPTY" LED "ON"?
   - Yes, press and hold the "DUMP BUTTON" on the main logic board. What number(s) are displayed?
     - #02: Hopper Exit window is blocked. Please do the following:
       1. Remove all the coins.
       2. Take off the Track side cover of the hopper.
       3. Remove the object from the window.
       4. Reassemble the hopper.
     - #01: The hopper has a low coin shut down. Please do the following:
       1. Ensure the hopper is full of coins. Turn off the machine, wait 5 sec then turn it back on again.
       2. Clean the 3 gold plates at the bottom of the hopper where the coins are poured in with a scotch bright pad or emery cloth.
       3. Check continuity of the wires from the gold plates back to the logic board.
   - No, proceed to the next question.

2. Is the GREEN LED on the main logic board on?
   - Yes, is the On/Off (I/O) switch on? (I pressed down?)
     - Yes, is the 120VAC plug pushed into the bottom of the logic board and into the wall?
       - Yes, using a meter check the 2-amp fuse. Is it good?
         - Yes, check the 120VAC wall breaker.
         - No, replace the fuse then the logic board.
       - No, replace the hopper or hopper harness.
     - No, the hopper is jammed.

3. Are the RED bill meter numbers lit on the main logic display?
   - Yes, proceed to the next question.
   - No, the CoinCo bill acceptor attempt to pull bills in at all?
     - Yes, it appears as if your CoinCo is dirty or the belts are worn. Please try the following:
       1. Go to Page 7 and perform the cleaning procedure.
       2. If that is unsuccessful inspect the plastic lower housing for deep scratches or VANDALISM.
       3. If the CoinCo has accepted over 50,000 bills it could need new belts.
     - No, proceed to the next question.

4. Will the CoinCo bill acceptor attempt to pull bills in at all?
   - Yes, proceed to the next question.
   - No, proceed to the next question.

For a more detailed trouble shooting information proceed to the next section!

FOR TECHNICAL SERVICE OR TO OBTAIN A RETURN AUTHORIZATION NUMBER CALL (888) 741-9840
ANY REPAIR RETURNED WITHOUT A RETURN AUTH. # WILL BE REFUSED!!
## Problem: The changer is completely dead.
(The green LED on the main logic board is not lit.)

1. Ensure the changer is plugged in.
2. Ensure the on/off switch is rocked to the (1) position (down).
3. Unplug the female end of the line cord from the main logic board AC connector and plug it in again tightly.
4. Measure the AC voltage at the outlet or check the breaker/fuse box. You can also plug another item into the AC wall outlet to ensure there is power present at the outlet.
5. Inspect the AC line cord for cuts or abrasions.
6. Check both fuses on the Main Logic Board.
7. Replace the main logic board.
8. Replace the line cord.

## Problem: The “Empty LED is lit.
The decimal point on the light-up number display is “off” more than it is “on”.

1. Ensure the hoppers are not out of coins. (There should be enough coins in the hoppers to cover the gold low level contact plates approximately $30-$40. These plates are located at the bottom of the hoppers where you pour the coins.)
2. Check the hoppers wire harness that extends from the back of the plate that the hoppers slide in and out on for chipped pieces or other damage. (Pay close attention to pins # 2 & 7.)
3. Clean the gold contact plates with steel wool.
4. Perform the following steps:
   A. Turn the changer off.
   B. Ensure the left hopper plate red connector on the left side of the main logic board (MLB) is plugged into the bottom connector, and the right is plugged into the top connector.
   C. On the MLB slide all the dipswitches left to the “off” position.
   D. On the left DipSwitch slide #3 “ON” enabling a 4 coin per dollar payout.
   E. On the right Dip switch slide #8 “ON” disabling the top hopper connector and enabling the changer into the “One Hopper Mode”
   F. Turn the changer on.
   G. If the “Empty” LED on the front of the changer is now off, remove the right hopper and service this hopper. The changer will function in this mode until the hopper is fixed.
   H. If the “Empty” LED is still “on”, turn the changer off and switch the hoppers, and turn the changer back on.
   I. If the “Empty” LED on the front of the changer is now off, remove the right hopper and service this hopper. The changer will function in this mode until the hopper is fixed. Remember to remove the coin chute from the hopper or the coins will fall into the changer instead of into the coin cup!
   J. If the “Empty” LED is still “ON”, turn off the changer.
   K. Reverse the hopper's plate connections, (top to bottom, bottom to top), and repeat steps F thru 1. Keep in mind that you are troubleshooting the Hopper Plates instead of the hoppers.
5. Replace the Main Logic Board.
6. Replace both hoppers.
7. Replace both hopper plates with the harnesses.
<table>
<thead>
<tr>
<th>PROBLEM:</th>
<th>SOLUTION:</th>
</tr>
</thead>
<tbody>
<tr>
<td>D. The green LED on the Main Logic Board is lit but the Light-up display does not.</td>
<td>1. Bad 5 or 12vdc regulator on the main logic board.</td>
</tr>
<tr>
<td></td>
<td>2. The hoppers are shorted.</td>
</tr>
<tr>
<td></td>
<td>3. Replace main logic board.</td>
</tr>
<tr>
<td></td>
<td>4. Replace hoppers.</td>
</tr>
<tr>
<td>E. The bill validator accepts and stacks the bills, but the meter does not increase.</td>
<td>1. Check continuity and for pin damage to the blue and yellow wires on the validator harness.</td>
</tr>
<tr>
<td></td>
<td>2. Replace the validator wire harness.</td>
</tr>
<tr>
<td></td>
<td>3. Replace the validator.</td>
</tr>
<tr>
<td>F. The bill validator accepts and stacks the bills, and the meter does increase.</td>
<td>1. Ensure the dip switch settings are still correct. (#3 “ON” only)</td>
</tr>
<tr>
<td></td>
<td>2. Check the continuity of the brown and purple wires on the hoppers wire harness.</td>
</tr>
<tr>
<td></td>
<td>3. The hopper is jammed. Go to pgs.29-31, Un-jam the hoppers.</td>
</tr>
<tr>
<td></td>
<td>4. Replace the hoppers wire harness.</td>
</tr>
<tr>
<td>G. The bill validator will not pull in the bill and the “Empty” LED is not lit.</td>
<td>1. Ensure the orange wire going to the “Empty” LED is connected to the + or the terminal with the red mark by it.</td>
</tr>
<tr>
<td></td>
<td>2. Check for 12vdc going to the orange and brown wires. If there is, replace the LED.</td>
</tr>
<tr>
<td></td>
<td>3. Replace the main logic board.</td>
</tr>
<tr>
<td></td>
<td>4. Replace the bill validator.</td>
</tr>
<tr>
<td></td>
<td>5. Replace the validator wire harness.</td>
</tr>
<tr>
<td>H. The bill validator pulls in the bill slightly then rejects it.</td>
<td>1. Clean the validator. (pg.20)</td>
</tr>
<tr>
<td></td>
<td>2. Remove the lower housing (pg. 17) of the bill validator. Ensure the center wheel spins freely. Push straight down on it slightly to loosen.</td>
</tr>
<tr>
<td></td>
<td>3. Replace the bill validator.</td>
</tr>
<tr>
<td>I. The bill validator red status LED flashes a “5” error code.</td>
<td>1. Clean the validator optic LED’s. (See pg.20)</td>
</tr>
<tr>
<td></td>
<td>2. Ensure that all the wire harness plugs are plugged firmly into their white female sockets.</td>
</tr>
<tr>
<td></td>
<td>3. Turn to the back page of this manual and check for a Coin Acceptors branch in your area to repair your bill validator.</td>
</tr>
<tr>
<td>J. The bill validator red status LED flashes a “6 or 7” error code.</td>
<td>1. Take the bill stacker off the bill validator. Cycle the power on / off using the switch on the main logic board and coast the silver push bar so that it stops in its fully extended position. Blow out the area behind the push bar with high pressure or canned air. Concentrate on the encoder wheel in the area top center behind the push bar.</td>
</tr>
<tr>
<td></td>
<td>2. Turn to the back page of this manual and check for a Coin Acceptors branch in your area to repair your bill validator.</td>
</tr>
<tr>
<td>K. The bill validators red status LED is on steady but it still will not accept the bill.</td>
<td>1. Pull out the lower housing, see page 12, and look for something obstructing the bill path. (i.e. gum, papers, tickets, coins, etc.)</td>
</tr>
<tr>
<td></td>
<td>2. Look inside the Plexiglas case on the side of the bill validator. Ensure that all the wire harness plugs are plugged firmly into their white female sockets.</td>
</tr>
